Foreword

The 77000 Series LO-DB® valves provide control of high pressure compressible fluids without the erosion, vibration and high noise levels associated with conventionally designed control valves. Because of their relatively large flow passages and a shearing action provided by their multiple step plug and seat ring designs, these valves are particularly well suited for applications involving gases with entrained liquids/solids or liquids with entrained solids.

Adiabatic Flow with Friction

The principle of "Adiabatic Flow with Friction" is to reduce pressure much like the pressure loss which occurs in a long pipeline. This effect is produced by letting the fluid pass through a number of restrictions providing a tortuous flow pattern dissipating energy through high headloss rather than through shock waves.

The flow area of the valve trim is gradually increased toward the downstream section. This compensates for expansion of the gas with pressure drop and ensures a nearly constant fluid velocity throughout the complete throttling process.

The reduced velocity thus minimizes the impact erosion of entrained liquids. The acoustical performance of the 77000 is optimal when pressure ratio does not exceed trim expansion ratio. For higher pressure ratios, LO-DB cartridges in the outlet or special design trim are recommended.

For liquid service, special trim with multiple linear stages followed by expanding stages provides the optimum in cavitation and erosion control.

Smooth, Stable Control; Fail Safe Action

The high rangeability (50:1) of this LO-DB valve allows wide variations in controlled flow. Operation is stable because the low static unbalance is achieved by support intermediate pressure through internal plug porting, a balance force exists within the plug which reduces the unbalanced force to a minimum. The valve will fail in the proper direction by the actuator spring on air failure. This uniquely balanced trim has no secondary balancing seal and only one seat. Toggle actuation provides a high force amplification and allows extremely good throttling control. The short valve travel reduces packing wear and significantly extends packing life particularly in high pressure/temperature service.

Tight Shutoff

Protection from seat erosion is ensured by provision of ANSI FCI 70.2, Class V Seat Leakage when standard metal seats are furnished.

High Allowable Pressure Drops

With a balanced trim, a wide range of allowable pressure drops are available with conventional spring diaphragm or positioning cylinder actuators.

Simple Maintenance

The multiple step trim made from specially chosen hard materials gives maximum service life and the quick change seat ring design provides ease of trim replacement.

Due to short stroke, heavy guiding and velocity control trim, these valves are capable of extended service life without maintenance.

Numbering System

NOTE: 900 lbs. ANSI inlet rating is available.

General Data

- **Body**
 - type: high pressure angle
 - flow direction: side in - bottom out
 - Cv ratio : 50:1
 - **Bonnet**
 - type: integral
 - **Outlet Adapter**
 - bolted to body w/outlet flange
 - **Materials Body and Adapter**
 - forged carbon steel
 - stainless steel
 - chrome molybdenum steel
 - special alloys
 - alloy overlays
 - **Trim**
 - flow characteristic: linear
 - **Actuator**
 - type: spring diaphragm or double acting pneumatic piston, toggle or direct drive operated
 - supply pressure: see tables and individual actuator bulletins
 - failure mode: open/close or fail in position, spring or pneumatic powered
 - manual override: side mounted handwheel hydraulic hand jack
- NOTE:** Optional materials to conform to requirements of NACE MR01-75.
