Foreword

The 78200/18200 Series *LINCOLNLOG*TM valves provide smooth and accurate capacity control of high pressure drop liquids without cavitation, erosion, vibration and high noise levels associated with conventional single stage control devices.

Masoneilan's Lincolnlog valve design is based on the principle of high resistance multistep axial flow trim. In an axial flow trim, fluid flow is parallel to the axis of the plug and cage. Pressure reduction occurs along the length of the plug; therefore, no individual stage is ever exposed to the full pressure differential. As a result, trim life is greatly extended

The Lincolnlog trim design offers a unique configuration with a series of equal capacity stages, to control erosion, followed with last stage expansion to reduce the potential for cavitation. This valve staging is designed to limit pressure drop per stage, controlling fluid velocity and greatly extending trim life in severe services.

Because of the relatively large flow passages and shearing action provided by the multistep plug and cage designs, these valves are particularly well-suited for applications involving fluids with entrained particles, a potentially serious problem for other valve designs which are subject to clogged flow passages. Good throttling resolution is provided on even small C_vs .

Simple trim construction eliminates maintenance problems and allows for easy custom design to meet specific applications.

Optional trim staging configurations can be provided for compressible, two-phase, and flashing fluid conditions. A higher number of stages can be provided for higher P requirements.

Tight Shutoff

Protection against seat erosion is ensured by provision of ANSI FCI 70.2 Class V seat shutoff when standard metal seats are furnished. Class VI seat shutoff is available when optional soft seats are supplied.

High Allowable Pressure Drops

With balanced trim for valve sizes $1^{1/2}$ " through 8", a wide range of allowable pressure drops is available with conventional spring diaphragm or piston actuators. Trim and body materials are available for NACE and corrosive applications.

The unbalanced trim design is suitable for slurry or high temperature services. Valves are provided with large diameter stems and appropriate actuators, allowing high pressure drops in unbalanced construction.

Variation of Body Configurations

Standard angle or globe body styles with various end connection configurations are offered to accommodate a variety of piping requirements. Oversized or reduced end connections are available and face-to-face dimensions may be matched to existing installations.

Lincolnlog valve bodies are available in cast globe or forged globe and angle designs. A variety of carbon, low alloy, and high alloy steels are available.

Typical Applications

Power Industry

Boiler feed pump recirculation Desuperheater spray nozzle control Labyrinth pump seal pressure control Feedwater start-up regulators Economizer bypass

Oilfield

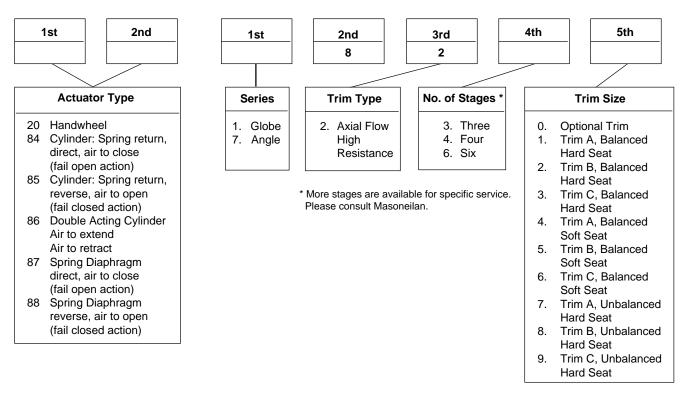

Water injection pump recirculation Produced/waste water injection well control H. P. separator letdown

Refinery

H₂S contactor letdown (DEA, MEA, Glycol) Charge pump recirculation Reactor cold separator letdown

Trim Details

Characteristics

The Lincolnlog trim has a basic linear control characteristic.

The trim is designed for "clearance" flow capacity over 15% of the initial valve travel.

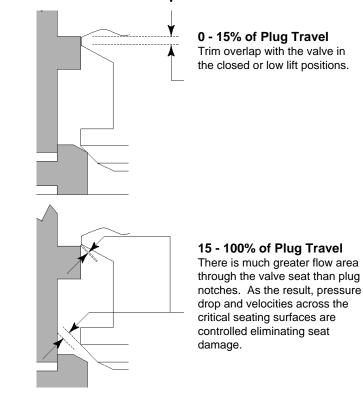

The multistage "clearance" flow design has been introduced intentionally to avoid high pressure drops in the seating area during throttling at low capacity. This feature extends the shutoff capability significantly and has a positive influence on the throttling control capability at low capacity of this design.

Lincolnlog C_v vs. Travel

The 15 to 100% of the plug travel provides smooth, accurate and continuous capacity control.

Controllability extends from maximum C_v value to minimum controllable C_v and provides a controllable turndown of 50:1 for all except the smallest sizes.

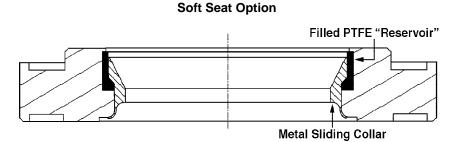

Lincolnlog Trim Overlap Seat Protection and C_v vs. Travel

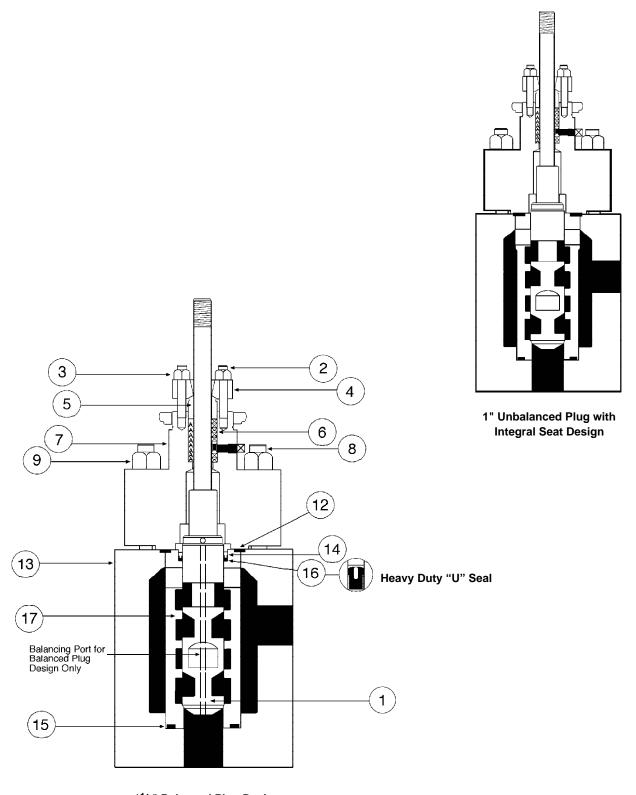

Soft Seat Design (Available in 2" - 8" Sizes)

The "sliding collar" soft seat is a patented Masoneilan design feature. In combination with the 15% trim overlap design in flow to open direction, it will provide long term shutoff capability and minimal maintenance.

Fluid pressure pushes the collar up to protect the elastomer seat when the valve is throttling. The "reservoir" of filled PTFE material compensates for wear of the seat as well.

① Consult factory for unbalanced trim pressure drops or high temperature applications over 450°F.

② For air to open action, the actuator must have double acting positioner or use 4-way solenoid for Class V or Class VI shutoff. Without air on the spring side of the cylinder, the valve shutoff rating is Class III.

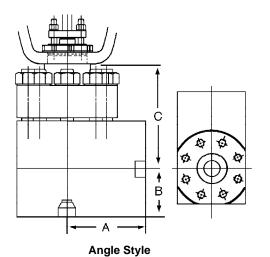

Spring Cylinder Positioner Selection: 6" - 8" Moore 750P/750E or Bailey AV1/AV2.

LINCOLNLOG[™] Valve Sizing Guidelines

Lincolnlog multistep control valves can be sized using standard ISA equations, the sizing procedures from Masoneilan Sizing Handbook, or the computer sizing program furnished by Masoneilan.

Noise calculations are best performed by using the computerized program. The serial stage configuration of the Lincolnlog design reduces valve trim noise significantly. The actual valve noise can be approximated by calculating the last stage noise, using the standard noise calculation procedures. The P of the last stage for approximate noise calculating can be derived from the table below.

Selection of the correct trim can be made by determining the P/ stage from the table below. It is good practice to limit the P/stage to 800 psi for continuous duty cycle and to 1000 psi for intermittent duty. The resulting recommended P throttling is shown in the same table.

For flashing flow conditions, the expansion ratio of the fluid shall approximate the staging ratio of the selected trim. Nonstandard staging ratios for compressible, two-phase or flashing conditions can be provided. Please consult factory.

For proper sizing of two-phase and flashing fluid, the inlet and outlet density of the fluid needs to be determined.

| Trim Type | No. of Stages | Staging Ratio | P Fraction per Stage | Continuous Operation | Intermittent Operation |
|--------------|------------------|------------------|---|-------------------------|---------------------------|
| с | 3 | 1-1-2 | .44 Stage 1 to 2 .11 Stage 3 | 1800 | 2250 |
| С | 4 | 1-1-1-2 | .31 Stage 1 to 3 .08 Stage 4 | 2600 | 3250 |
| В | 4 | 1-1-2-3 | .42 Stage 1 and 2 .11 Stage 3 .05 Stage 4 | 1890 | 2360 |
| Α | 4 | 1-1-2-4 | .43 Stage 1 and 2 .11 Stage 3 .03 Stage 4 | 1850 | 2325 |
| с | 6 | 1-1-1-1-2 | .19 Stage 1 to 5 .05 Stage 6 | 4225 | 5260 |
| в | 6 | 1-1-1-2-3 | .23 Stage 1 to 4 .06 Stage 5 .025 Stage 6 | 3500 | 4375 |
| A | 6 | 1-1-1-2-4 | .23 Stage 1 to 4 .06 Stage 5 .014 Stage 6 | 3450 | 4300 |
